

## **Intrinsyc offers mobile phones with more functionality**

February 13, 2006 - Globe and Mail Update

Vancouver-based [Intrinsyc Software International Inc.](#), a provider of mobility software and services, has released Soleus, a development platform for feature phones using the Microsoft Windows CE operating system. Soleus is designed to create software that provides mobile phone manufacturers with more cost-effective and feature-laden handset design options, including a suite of the most popular voice and data applications.

As part of the Soleus UI framework, the UI can be tailored to support specific market segments, end-user demographics, or other market requirements. A rich mobile phone Application Programming Interface enables easy integration between applications, by exposing all mobile phone services to every application. A partial list of the applications includes alarm, calculator, calendar, call history, camera, contacts, dialer, file manager, media player, and phone settings.
